Oncogeny and the Antiviral Action of Interferon. Grant #694R1

The objectives of these studies are to define unique steps in viral replication in the hope of developing specific antiviral drugs. Current objectives include:

(a) Purification and characterization of the subunit structure of human interferon.

(b) Determining structural requirements of ribopolymers for the induction of human interferon.

(c) Determining molecular loci of action of interferon.

(d) Determining molecular events necessary for transformation of cells by the oncogenic virus SV_{40}.

Current Grant Level: $29,193.
